

ABSTRACT OF THE DISCLOSURE

The UV2D reader reads the information encoded on the back of a Driver' License, Liquor ID, Identification card, Military ID, Government ID, Corporate ID or any ID where information is being sent to a host device. Upon receiving the license data, the host device can send a command to the UV2D imager to trigger the UV led board for any duration of time to enable the user to authenticate the License or Id being read. This command can also be used in conjunction with data gathered by a magnetic strip, smart cards, or keyed data.
